

Truss Jibs

Truss Jibs - Truss jib's could be utilized to carry, transport and place trusses. The attachment is designed to function as an extended jib additional part together with a pyramid or triangular shaped frame. Typically, truss jibs are mounted on machines like for example a compact telehandler, a skid steer loader or even a forklift utilizing a quick-coupler accessory.

Older kind cranes which have deep triangular truss jibs are usually assemble and fastened with bolts and rivets into standard open structural shapes. There are rarely any welds on these style jibs. Each bolted or riveted joint is prone to rust and thus requires regular maintenance and check up.

A general design attribute of the truss jib is the back-to-back assembly of lacing members. These are separated by the width of the flange thickness of an additional structural member. This particular design causes narrow separation amid the flat exteriors of the lacings. There is limited access and little room to preserve and clean them against rusting. A lot of rivets loosen and corrode inside their bores and must be changed.
